Chat Application with multiple rooms using Node and Express

ExpNo.10 Date:24-04-21

Objective:

- To Create a chat application with multiple rooms using Node and Express and socket.io module.
- To implement Book ticket form for my tourism website.
- Based on number of adults and children given as input by the user and the monument chosen total cost is updated.
- As user selects and deselects a checkbox accordingly date of visit will be displayed(Date of visit to a particular monument is available only for 31days from March1 to April1)
- User has to enter his/her Name and Emailid which is validated using angular JS.
- Live Chat Option has been enabled for users to ask any queries and the authorized person will reply to the queries asked by the user.

Requirements:

• Front End Requirements:

- 1. Web Browser HTML support
- 2. HTML
- 3. CSS
- 4. Javascript

• Back End Requirements:

- 1. NodeJS
- 2. Express
- 3. Socket.io

• Text Editor/IDE

Theory:

➤ Node js:

- Node js is a free and an open source environment
- It used javascript to run on server.
- Nodejs is used to generate dynamic page content.
- It executes javascript code outside browser.

> Express:

- Express is a minimal and flexible Node.js web application framework that provides a robust set of features to develop web and mobile applications. It facilitates the rapid development of Node based Web applications. Following are some of the core features of Express framework:
- Allows to set up middlewares to respond to HTTP Requests.
- Defines a routing table which is used to perform different actions based on HTTP Method and URL.
- Allows to dynamically render HTML Pages based on passing arguments to templates.
- > **Socket.io** is a Node.js module that enables real-time, bidirectional and event-based communication.
- > Socket.io usage examples:
 - Real-time analytics,
 - Binary streaming,
 - Instant messaging and chat,
 - Document collaboration (think about Google Docs)

Procedure:

- 1. On your command line interface (CLI): create our working directory using "mkdir node-group-chat" or use your convenient windows explorer, and then change our directory to our newly created working directory using "cd node-group-chat"
- 2. Initiate the project: By using "npm" command, you can initiate our project easily to create a file called "package.json".
- 3. Initiate the project by typing "npm init" and follow the guidance that appears in your terminal.
 - 4. Install modules: In this project, we are going to use at least two Node.js modules that we can easily install using NPM.
 - ...Working directory> npm install express
 - ...Working directory> npm install socket.io
 ...Working directory> npm install ejs
 - 5. Do the code:
 - 1) Start importing the needed modules: express, http, and socket.io.
 - 2) Write the code for server.js and index.ejs code in the views folder
 - 3) Create the UI.
 - 6.Start the server using node index.js

7.Open the browser and type http://localhost:8000 and type the same in another browser for creating multiple chat rooms.

Implementation:

ticket.html

       socket.emit('username', username);
```

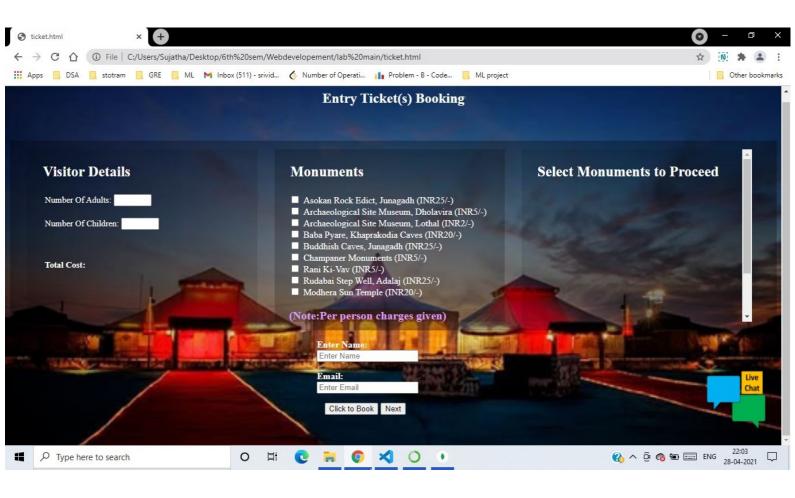

</script>
</body>
</html>

Output:

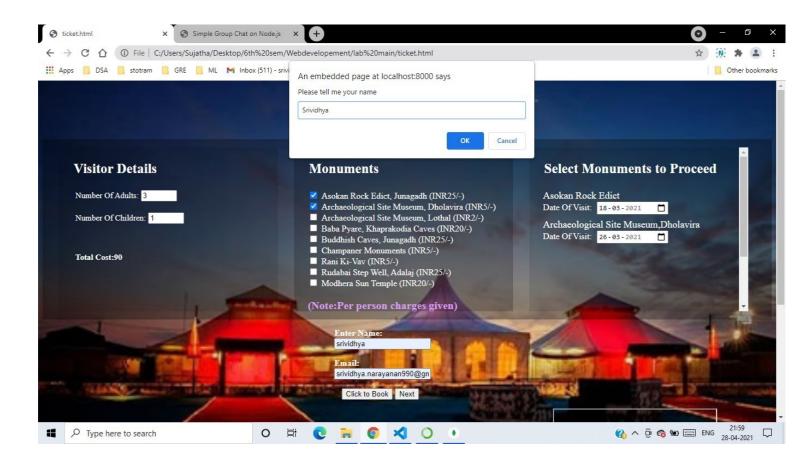

home.html

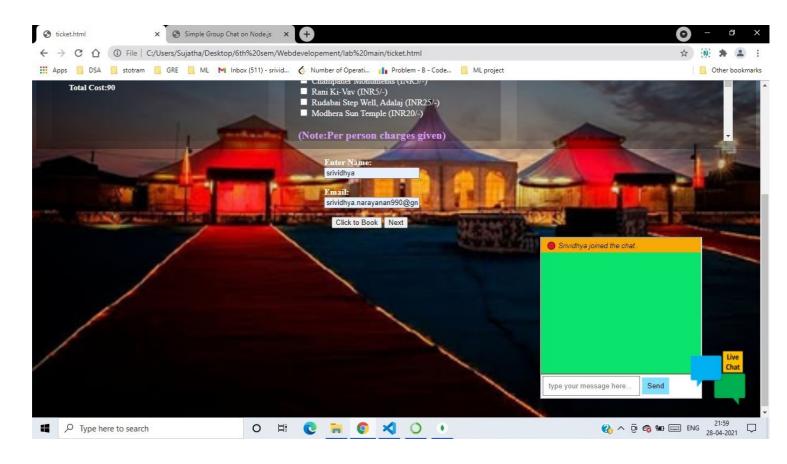

ticket.html: Added Live chat option for users to get their queries resolved.

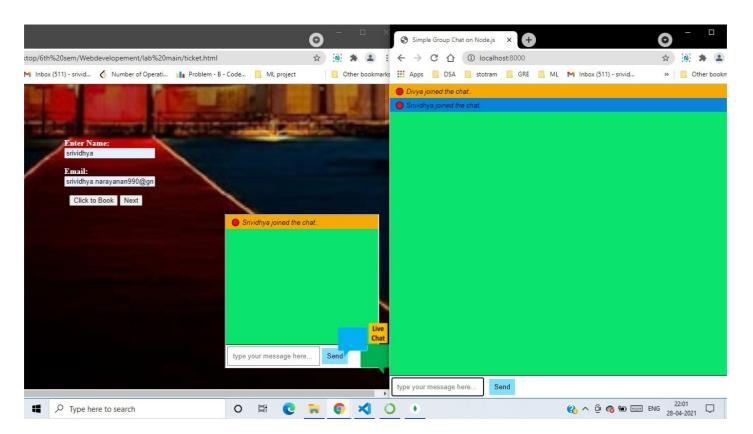

Prompts user to enter their name.

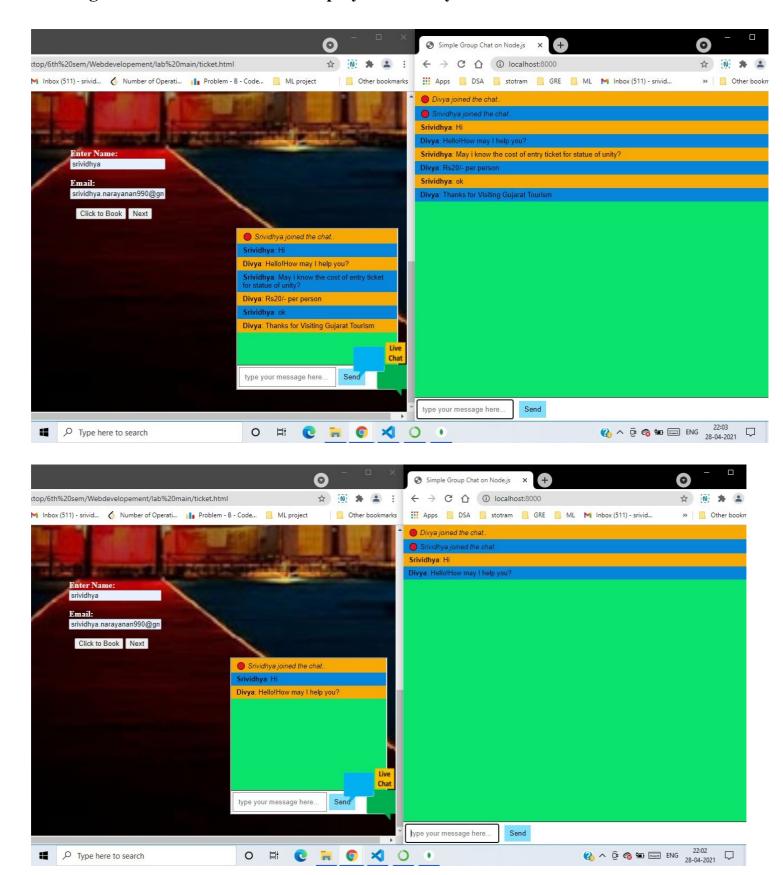

Chat box gets opened.

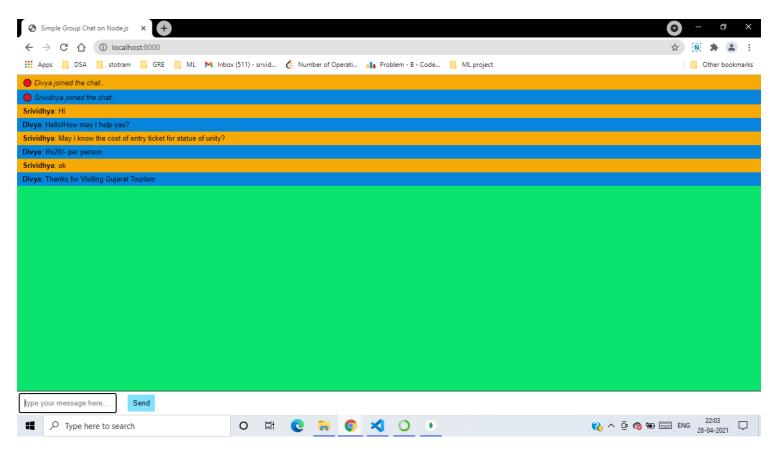

Multiple user chat room. Shows when user joins the chat.

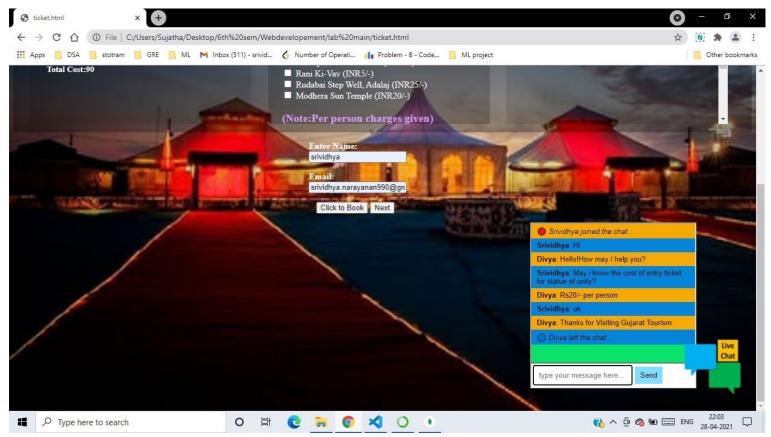

Messages can be sent and will be displayed instantly.

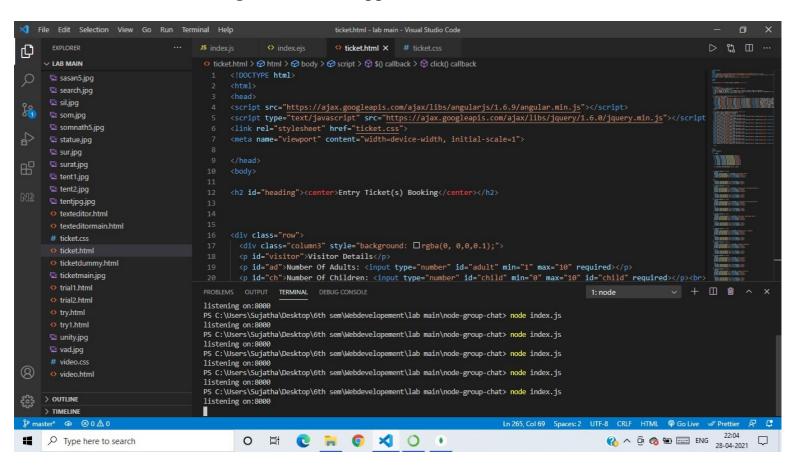

Also Displays when the user leaves the chat room.

Server runs in the background for the application to work.

Result: The chat room application was successfully created for my tourism website using node is, express, socket.io modules and verified.
